(54) Abstract Title

Annulus porting of horizontal tree

(57) A horizontal tree 11 has a vertical bore 13 and a horizontal production passage 19 and is landed in a wellhead housing. A tubing hanger 21 lands in the bore and has a vertical passage 25 and a horizontal passage 27 that aligns with that of the tree. A retrievable first plug 29 seals the vertical passage. A tree cap 37 seals in the tree bore above the tubing hanger via seals 49, 50 and has an axial passage 45. A retrievable second crown plug 51 seals the tree cap passage. A vent port to (Fig 2) extends laterally through the tree cap between its axial passage and outer surface. A pair of seals 58, 60 on the second plug seal above and below the vent port. A tubing annulus passage 83, 85 communicates with the vent port and an annulus passage 81. The second plug serves as a second pressure barrier to the first plug and blocks the vent port. The annulus passage is sealed from communication with a void between the plugs.

5 **ANNULUS PORTING OF HORIZONTAL TREE**

6 **INVENTOR: Lionel J. Milberger**
7

8 This application claims the benefit of S.N. 60/036,338
9
10

11 **Technical Field**

12 This invention relates in general to oil and gas
13 well Christmas trees, and in particular to a tree cap for
14 a horizontal tree.
15

16 **Background Art**

17 One type of wellhead assembly, particularly used
18 offshore, is known as a horizontal tree. The well has a
19 wellhead housing which contains casing hangers, each
20 secured to a string of production casing that extends
21 into the well. The tree mounts on top of the wellhead
22 housing. The tree has a vertical bore and a horizontal
23 or lateral production flow outlet. A tubing hanger lands
24 in the bore of the tree and is secured to a string of
25 production tubing extending through the casing hangers
26 and into the well. The tubing hanger has a lateral flow

1 passage that registers with the lateral passage of the
2 horizontal tree.

3 A plug, normally wireline retrievable, fits in the
4 vertical passage of the tubing hanger above the
5 horizontal passage. A tree cap fits above the tubing
6 hanger in the bore of the tree. The tree cap may have a
7 vertical passage within which the retrievable plug fits.
8 A corrosion cap fits over the upper end of the tree.

9 A tubing annulus between the tubing and the casing
10 communicates to a lower annulus port formed in the tree.
11 This port leads through an annulus passage to an upper
12 annulus port which extends into the bore of the tree
13 above the tubing hanger seals. One or more valves are
14 used to open and close the tubing annulus. The upper
15 tubing annulus port communicates with a void that is
16 located between the tubing hanger wireline plug and the
17 seal of the internal tree cap.

18 19 Summary of the Invention

20 A horizontal tree has a vertical bore and a
21 horizontal production passage and is landed in a wellhead
22 housing. A tubing hanger lands in the bore and has a
23 vertical passage and a horizontal passage that aligns

1 with that of the tree. A retrievable first plug seals
2 the vertical passage. A tree cap seals in the tree bore
3 above the tubing hanger and has an axial passage. A
4 retrievable second plug seals the tree cap passage. A
5 vent port extends laterally through the tree cap between
6 its axial passage and outer surface. A pair of seals on
7 the second plug seal above and below the vent port. A
8 tubing annulus passage communicates with the vent port
9 and an annulus passage. The second plug serves as a
10 second pressure barrier to the first plug and blocks the
11 vent port. The annulus passage is sealed from
12 communication with a void between the plugs.

13
14 Brief Description of Drawings

15 Figure 1 is a vertical sectional view of a portion
16 of a horizontal tree constructed in accordance with the
17 invention.

18 Figure 2 is an enlarged view of an upper portion of
19 the horizontal tree of Figure 1.
20

1 Best Mode for Carrying Out the Invention

2 Referring to Figure 1, christmas tree 11 is of a
3 type known as a horizontal tree. It has a vertical or
4 axial tree bore 13 extending completely through it. A
5 set of grooves 15 are located on the exterior near the
6 upper end for connection to a drilling riser (not shown).
7 A removable corrosion cover 17 fits over the upper end of
8 tree 11. Tree 11 has a lateral production passage 19
9 that extends generally horizontally from bore 13 and is
10 controlled by a valve 20. Tree 11 will be landed on top
11 of a wellhead housing (not shown) which has casing
12 extending into a well.

13 A tubing hanger 21 lands sealingly in bore 13.
14 Tubing hanger 21 is secured to tree 11 by a lock down
15 mechanism 22. A string of production tubing 23 extends
16 through the casing hangers (not shown) into the well for
17 the flow of production fluid. Production tubing 23
18 communicates with a vertical passage 25 that extends
19 through tubing hanger 21. A lateral passage 27 extends
20 from vertical passage 25 and aligns with tree lateral
21 passage 19.

22 A wireline retrievable plug 29 will lock in vertical
23 passage 25, sealing the upper end of vertical passage 25.

1 Tubing hanger 21 has an upper seal 31 located above
2 lateral passage 27 and a lower seal 33 located below
3 lateral passage 27. Seals 31 and 33 seal to bore 13 of
4 tree 11. Radial ports 35 in tubing hanger 21 are used to
5 communicate hydraulic fluid to a downhole safety valve.
6 These ports register with passages (not shown) formed in
7 tree 11.

8 A tree cap 37 inserts sealingly into tree bore 13
9 above tubing hanger 21. Tree cap 37 may have an axial
10 passage 45 that extends through tree cap 37. Axial
11 passage 45 has the same inner diameter as tubing hanger
12 passage 25. A locking mechanism 47 similar to that of
13 tubing hanger locking mechanism 22 is used to lock tree
14 cap 37 to tree 11. Tree cap 37 is sealed to tree bore 13
15 with an upper seal 49 and a lower seal 50. Lower seal 50
16 has a smaller outer diameter than upper seal 49. Tree
17 cap 37 has a depending neck 38 which inserts into a
18 receptacle in the top of axial passage 25 in tubing
19 hanger 21. Neck 38 does not seal in passage 25 so that
20 a clearance therebetween is maintained.

21 As shown in Figure 2, a wireline retrievable crown
22 plug 51 inserts into tree cap passage 45. Crown plug 51
23 has body 55 which has a metal seal 57 secured to its

1 lower end. Seal 57 is a depending lip that seals against
2 a tapered surface formed in tree cap passage 45. A vent
3 port 70 extends laterally through internal tree cap 37
4 from axial passage 45 to its outer surface. Body 55 has
5 a pair of circumferencial seals 58, 60 near its
6 midsection above seal 57. Seals 58, 60 are located above
7 and below a vent port 70 in passage 45, respectively.
8 Vent port 70 extends laterally through the sidewall of
9 tubing hanger 21.

10 Body 55 has a plurality of windows 59 which allows
11 dogs 61 to protrude through. When in the outer locked
12 position, dogs 61 will engage a groove 63 in tree cap
13 passage 45. A cam member 65 is carried reciprocally
14 within body 55. When in the lower position, cam member
15 65 keeps dogs 61 in the outer locked position. When cam
16 member 65 is pulled upward, it will allow dogs 61 to
17 retract from groove 63. Cam member 65 has a profile 66
18 on its upper end to allow engagement of a running and
19 retrieval tool (not shown). A retainer 67 secures to the
20 upper end of body 55 to retain cam member 65.

21 Referring again to Figure 1, a tubing annulus 81
22 surrounds tubing 23 between tubing 23 and the smallest
23 diameter string of casing (not shown). Tubing annulus 81

1 communicates with a lower annulus passage 83 that extends
2 from tree bore 13 through the wall of tree 11 below
3 tubing hanger seal 33. Lower annulus passage 83
4 communicates with an upper annulus passage 85 that
5 extends into tree bore 13 above tubing hanger seal 31 and
6 below locking mechanism 47. Referring to Figure 2,
7 passage 85 leads to the vent port 70 between both sets of
8 upper and lower seals 49, 50 and 58, 60. Passage 85
9 communicates with port 70 which joins axial passage 45.
10 Valves 87 are located in the tubing annulus passages 83
11 and 85.

12 In operation, after the well is drilled and cased,
13 horizontal tree 11 will be landed and connected to the
14 wellhead housing (not shown). Tubing 23 will be lowered
15 into the well on tubing hanger 21. Horizontal passage 27
16 will orient with passage 19 when tubing hanger 21 lands
17 in tree 11. Wireline plug 29 will be installed in tubing
18 hanger vertical passage 25.

19 Preferably, crown plug 51 will be installed in tree
20 cap 37 and pressure tested while tree cap 37 is at the
21 drilling rig. Tree cap 37 will be lowered on a running
22 tool on drill pipe. Crown plug 51 serves as a second
23 pressure barrier to wireline plug 29 and blocks port 70.

1 Passage 85 does not communicate with a void located
2 between plugs 29, 51 because of lower seals 50 and 57.
3 Since neck 38 does not seal against vertical passage 25,
4 the void between plugs 29, 51 communicates with bore 13
5 below seal 50. However, seal 50 blocks communication of
6 the void with annulus 81.

7 For a workover operation requiring the pulling of
8 tubing 23, the operator may use a drilling riser and
9 blowout preventer stack (not shown). After removal of
10 corrosion cover 17, the drilling riser will connect to
11 profile 15. Normally, a kill fluid will be circulated
12 into the well which is heavier than the well fluid to
13 prevent a blowout. The operator will land a running tool
14 on and pull internal tree cap 37 and run back in with an
15 inner riser string (not shown) which secures to the upper
16 end of tubing hanger 21. Upper tubing annulus passage 85
17 now communicates with an annulus surrounding the inner
18 riser, which in turn communicates with choke and kill
19 lines leading alongside the riser back to the drilling
20 rig. The operator will pull wireline plug 29 with a
21 wireline tool. A port (not shown) at the lower end of
22 tubing 23 will be opened to communicate the interior of
23 tubing 23 with tubing annulus 81. This may be done with

1 a wireline tool in a conventional manner. With
2 production valve 20 closed and tubing annulus valve 87
3 open, the operator can pump down the inner riser, down
4 tubing 23 and back up tubing annulus 81. The annulus
5 fluid circulates through annulus passages 83, 85 up tree
6 bore 13 and through the choke and kill lines to the
7 surface. After the kill fluid has been placed in the
8 well, the operator may pull production tubing 23.

9 Under some circumstances, an operator may wish to
10 achieve wireline intervention into tubing 23 without
11 killing the well and without using the drilling riser.
12 Wireline access is achievable with the well under flowing
13 conditions. A wireline riser (not shown) will be
14 installed in the upper portion of passage 45 of tree cap
15 37. The operator can use a wireline tool to engage crown
16 plug 51. The operator will retrieve plugs 29 and 51 in
17 a conventional manner to perform the wireline
18 intervention.

19 The invention has several advantages. The tubing
20 annulus has sealed barriers in the internal tree cap and
21 the crown plug. The void between the plugs is isolated
22 from the tubing annulus.

1 While the invention has been shown in only one of
2 its forms, it should be apparent to those skilled in the
3 art that it is not so limited, but is susceptible to
4 various changes without departing from the scope of the
5 invention.
6

1 I claim:

2 1. A wellhead assembly, comprising in combination:
3 a christmas tree having an axial bore and a lateral
4 production passage;
5 a tubing hanger landed in the bore of the tree and
6 having an axial bore and a lateral opening that aligns
7 with the lateral production passage in the tree;
8 a retrievable first plug landed in the bore of the
9 tubing hanger above the lateral opening;
10 an internal tree cap assembly landed in the bore of
11 the tree above the tubing hanger;
12 a pair of seals axially spaced apart for sealing the
13 internal tree cap assembly in the bore of the tree;
14 a tubing annulus passage extending through the tree
15 to the bore in the tree above the tubing hanger;
16 a tubing annulus port extending through the internal
17 tree cap assembly from between the pair of seals to the
18 tubing annulus passage; and wherein
19 a lower seal of the pair of seals separates the
20 tubing annulus port from the first plug.
21

1 2. The wellhead assembly of claim 1, further comprising
2 a retrievable second plug landed in an axial passage of
3 the internal tree cap assembly.

4
5 3. The wellhead assembly of claim 1 wherein the
6 internal tree cap has an axial passage and the tubing
7 annulus port extends from an exterior surface of the
8 internal tree cap to the axial passage; and wherein the
9 wellhead assembly further comprises:

10 a retrievable second plug landed in the axial
11 passage of the internal tree cap assembly and blocking
12 the tubing annulus port; and

13 a seal on the second plug for sealing the axial
14 passage above the tubing annulus port.

15
16 4. The wellhead assembly of claim 1 wherein the
17 internal tree cap has an axial passage and the tubing
18 annulus port extends from an exterior surface of the
19 internal tree cap to the axial passage; and wherein the
20 wellhead assembly further comprises:

21 a retrievable second plug landed in the axial
22 passage of the internal tree cap assembly and blocking
23 the tubing annulus port;

1 an upper seal on the second plug for sealing the
2 axial passage above the tubing annulus port; and

3 a lower seal on the second plug for sealing the
4 axial passage below the tubing annulus port.

5
6 5. The wellhead assembly of claim 1 wherein the
7 internal tree cap has an axial passage and the tubing
8 annulus port extends laterally through a sidewall of the
9 internal tree cap from an exterior surface to the axial
10 passage; and wherein the wellhead assembly further
11 comprises:

12 a retrievable second plug landed in the axial
13 passage of the internal tree cap assembly and blocking
14 the tubing annulus port; and

15 a seal on the second plug for sealing the axial
16 passage above the tubing annulus port.

17
18 6. A wellhead assembly, comprising in combination:

19 a christmas tree having an axial bore and a lateral
20 production passage;

21 a tubing hanger landed in the bore of the tree and
22 having a lateral opening that aligns with the lateral
23 production passage in the tree and an axial bore;

1 a retrievable first plug landed in the bore of the
2 tubing hanger above the lateral opening;

3 an internal tree cap landed in the bore of the tree
4 above the tubing hanger and having an axial passage;

5 upper and lower seals located between the internal
6 tree cap and the tree;

7 a vent port extending through the internal tree cap
8 from an exterior sidewall to the axial passage between
9 the upper and lower seals;

10 a tubing annulus passage in the tree which registers
11 with the vent port;

12 a retrievable second plug landed in the axial
13 passage of the tree cap; and

14 seals on the second plug which seal a junction of
15 the vent port with the axial passage.
16

17 7. The wellhead assembly of claim 6 wherein the seals
18 on the second plug comprise upper and lower seals on the
19 second plug which locate above and below the vent port.
20

21 8. A method for providing a tubing annulus access in a
22 wellhead assembly having a tree, a tubing hanger and a
23 first plug, comprising:

1 providing an internal tree cap with an axial passage
2 and a lateral vent port extending through a sidewall to
3 the axial passage, the vent port registering with an
4 annulus passage extending through the tree from the
5 tubing annulus;

6 landing and sealing the internal tree cap in the
7 tree; and then

8 landing and sealing a second plug in the internal
9 tree cap adjacent to the vent port such that the second
10 plug seals the vent port from communication with the
11 axial passage.
